What is the intended purpose of your application?
It will be used as a digital pantry that stores all the food in a user's pantry

What data will be stored and delivered by the API?
The user's pantry data

What work has been completed for this prototype?
Currently It is only a bare bones project with barely any data

What work is left, and how do you plan to complete it?
Fixing the API, Displaying data, Adding front end styling

Do you have a plan for going above and beyond? If so, what is it?
I plan on using the Bulma CSS framework as well as potentially linking my
IGME 330 project 3 API which returns recipes based on ingredients
provided. Additionally, I would like to use a cloud based storage system to
store the data so that users can come back to it but that might be a long
stretch

If you used any borrowed code or code fragments, where did you get them
from?
I have used some code from my IGME 330 project 3.

What do the code fragments do? Where are they in your code?
They are custom web components like the nav bar (incomplete) and footer
